

Windows WSL (Ubuntu) Setup Guide

Terminus Edition 2 Environment Configuration

Prerequisites

- Windows 10 or Windows 11
- Administrator access to enable WSL
- Stable internet connection

Phase 1: WSL Preparation & System Dependencies

Step 1: Install WSL and Ubuntu

Open Windows PowerShell as Administrator and run:

```
wsl --install
```

Restart your computer if prompted. This will install the default Ubuntu distribution. Once restarted, open the "Ubuntu" app from your Start menu and set up your UNIX username and password.

Step 2: Install Docker Desktop with WSL Integration

1. Download and install **Docker Desktop** for Windows from the official website.
2. Open Docker Desktop, go to **Settings (Gear icon) > Resources > WSL Integration**.
3. Ensure the toggle for your default WSL distro (Ubuntu) is turned **ON**.
4. Apply and restart Docker Desktop.

Note: All terminal commands from Step 3 onward must be executed inside your **Ubuntu terminal**, not Windows PowerShell.

Step 3: Install Python 3.12 and Zip

Open your Ubuntu terminal and update your package lists, then install Python 3.12 and the zip utility:

```
sudo apt update
sudo apt install software-properties-common -y
sudo add-apt-repository ppa:deadsnakes/ppa -y
sudo apt update
sudo apt install python3.12 python3.12-venv zip -y
```

Phase 2: Terminus Tooling

Step 4: Install uv

Install the fast Python package installer:

```
curl -LsSf https://astral.sh/uv/install.sh | sh
source $HOME/.local/bin/env
```

Step 5: Install the stb CLI

Install the Snorkel Terminus Benchmark (stb) tool:

```
uv tool install snorkelai-stb --find-links https://snorkel-python-
wheels.s3.us-west-2.amazonaws.com/stb/index.html --python ">=3.12"
```

Step 6: Authenticate with Snorkel

Run the login command to link your local CLI to your account:

```
stb login
```

This will provide a URL to open in your Windows browser. Generate your API key, copy it, and paste it back into your Ubuntu terminal prompt.

Phase 3: Verification and Workflow

Step 7: Configure PATH & Verify

Ensure the tools load automatically when you open a new terminal:

```
echo 'source $HOME/.local/bin/env' >> ~/.bashrc  
source ~/.bashrc
```

Run these checks to confirm the system is operational:

```
docker ps  
stb --version  
stb projects list
```

Daily Workflow Commands

Navigate to your WSL project directories (usually inside ~) rather than mounted Windows drives (/mnt/c/) for better Docker performance.

To run the Oracle (Local Verification):

```
stb harbor run -a oracle -p ./my-task --debug --force-build 2>&1 | tail -20
```

To package your task into a zip file (Run this inside your task directory):

```
cd ~/my-task  
zip -r ../my-task.zip . --exclude "*.snorkel_config"
```
